

SHY PLACE SOLAR PARK | 250 megawatts

IN DEVELOPMENT | aiming for construction in 2027

📍 Jasper County northeast of Monticello

FREQUENTLY ASKED QUESTIONS:

What do the recent federal acts and executive orders mean for the American solar industry?

Without question, America needs more power to meet rising demands in the very-near term. Renewables are unequivocally the cheapest source of power available and the only source able to be built within the next few years, even without federal tax credits.

How will this impact Shy Place Solar Park?

While there are uncertainties about the exact implications, EDP Renewables North America is one of the strongest renewable energy companies in the US with experienced, dedicated teams focused on safeguarding our projects. Shy Place is still a priority project for EDPR NA and we are making steady progress on it. Recent federal actions haven't impacted its viability and we're confident in Shy Place's future.

Will the renewables industry survive without tax credits?

Tax credits are a tool the government utilizes to lower initial costs for essential industries that keep our country running and minimize those costs being passed onto consumers. This helps spur innovation, remove barriers for economic growth, and generally ensure citizens' needs are met.

Utilities, tech companies, and other power purchasers are going to keep wanting renewable power because it is cheap and not entangled with volatile global fuel markets that cause major price fluctuations. Businesses prefer certainty, and renewables are a sure bet.

Do you have a question about Shy Place Solar Park or solar energy in general?

Email us at Landon.Redmon@edp.com or info@edpr.com and you may see your question answered in our next Monticello News ad!

Our team will answer questions directly via email regardless of whether or not the question is chosen to be highlighted in the paper.
